When the engine is running at full RPM, the spring rating is somewhat higher on the **Blue Spring** than the spring rating of the CVTech spring. The calibration can be adjusted by adding one shim into each block. Remember that one shim corresponds to 100 RPMs.

If the engagement RPM differs from the rated RPM of the motor, always check the spring adjustment and the alignment of the powerline.

Adjusting

Whenever you install a new clutch or repair the old one, always remember to check the tension and condition of the drive pulley spring.

Very often the spring is weak and unable to perform properly. If the spring in the drive pulley is weak, it allows the clutch to shift too early and causes the engine to run inefficiently. When replacing or tightening the spring, always use clean parts and do not use grease.

Powerline

Check the powerline with 12 mm thick iron bar. If there is no rubber stopper to stop the engine turning when using the throttle, then **Y** must be 1,0 - 1,5 mm bigger than **X**. Note also that due to a smaller clutch, the distance **Z** in your service manual does not exist. It is something else, but the difference is acceptable.
